

MY RECOMMENDATION

Build the small tools with Devin. Keep the big ones.

Devin can build the kind of small internal tools your team already builds.

01 Small tools: build them

Simple screens and workflows are quick to build and easy to keep running.

02 Big tools: wait

Rebuilding KYC means real integration work and ongoing maintenance for your team.

Devin writes the code.
Your team still supports it afterward.

What your tools do for you today.

RUNS YOUR APPS

Power Apps

It hosts and runs the three tools.

- Non-engineers can build screens
- Hosting and data are handled
- Connects to your other systems

Drop it and your team takes on that work.

HELPS ENGINEERS CODE

Cursor

Engineers write code faster with it.

- Works alongside them in the editor
- Can also run tasks in the cloud
- Already part of daily work

It could build these tools too.

DOES THE WORK FOR YOU

Devin

You hand it a task; it builds it.

- Writes code and tests
- Works on its own machine
- Opens pull requests to review

You still review and maintain the result.

\$200K Power Apps / year

\$500K AI tools / year

Numbers from the brief.

Dropping a tool may not save all of it.

Which tools are worth rebuilding?

ROUGH SENSE OF THE WORK INVOLVED

Easy to own

Hard to own

Small tools

A few screens, simple rules

Tools that pull real data

Need live systems and access rules

KYC review queue

Customer documents, audit trail, providers

A rough guide, not a measurement. Any tool gets harder as it connects to more systems.

WHAT WE STILL NEED TO ASK YOU

Is it a few people?

Two engineers want one extra feature.

Try changing Power Apps first. Cheaper and faster.

Is it everyone, every week?

Teams keep losing hours to the same tool.

Worth pricing out a rebuild and who maintains it.

The brief doesn't say which one it is. That answer changes the recommendation.

A small tool Devin built.

01 · WHAT THE OPERATOR DOES

Turn a feature on

Off → 25% → 100% → undo

Every change needs a reason and is listed in the history.

The change is the easy part

What matters is whether customers actually see it.

02 · WHAT THE CUSTOMER SEES

The checkout changes

Account → decision → screen

At 25%, Cedar gets the new checkout and Aurora does not. Undo puts it back.

A demo, not a real system

Test data only. Nothing connects to live systems.

TURN IT ON → SEE WHO GETS IT → UNDO IT

This is the size of tool I would build with Devin today.

It runs on my laptop with test data.

[The code Devin wrote ↗](#)

Run a one-month Devin pilot.

There is a lot of overlap between the two tools, and we believe Devin does everything Cursor does for your team and more. A month of real work is how you confirm that — give a group of engineers Devin, keep the rest on Cursor, and build one small internal tool along the way.

WHAT TO WATCH DURING THE MONTH

Do they use it?

Daily use, or back to Cursor

Is the work good?

What ships, what gets thrown out

How much babysitting?

Review and rework time

What does it cost?

Licenses, usage, upkeep

Can Devin replace Cursor?

If engineers prefer it and the work holds up, you stop paying for both.

Was the tool worth building?

Only if it earns the maintenance it creates.
